Instructions	`Load`, `Store`, `Branch_n`, `Branch_x`, `Other_n`, `Other_x` (Other: ALU op; `_n`: never transmits)
Booleans	`resolved`, `committed` (retired; implies resolved), `xmit` (the target transmitter)
Operands	inputs `inreg`, `inaddr`, `inmem`; outputs `outreg`, `outmem`
State	`Reg`, `Mem`; each operand names one
Relations	`spo` (speculative program order), `rf` (reads-from: an output to a later input), `ddi` (data-dependence internal: an input to an output of the same instruction)
