Graph	Alloy	Meaning
Instructions: one node each; its kind is one of		
Load	TLoad	reads memory at an address into a register
Store	TStore	writes a register to memory at an address
Branch_n/_x	TBranchn/x	conditional branch on a register
Other_n/_x	TOthern/x	ALU op: up to two registers in, one out
_x		potential transmitter (the defense's leakage function decides)
Operands and state		
$r0$, $m0$	Reg_s, Mem_s	an abstract register, memory location
out ← in	opstate	operands: inputs inreg, inaddr, inmem; outputs outreg, outmem; each names one location
$[r0]$	inaddr	address operand of a load or store
?		operand left unspecified; filled during concretization
Flags: italic words on an instruction's row		
resolved	isresolved	branch outcome (or memory address) is known; no word: unresolved
committed	iscommitted	retired, non-speculative; implies resolved; a prefix of program order
xmit	isxm	the test's one target transmitter
Relations: labelled edges		
row order	spo	program order, top to bottom (total)
rf	rf	reads-from: an output operand to an input operand of a later instruction, same location
ddi	ddi	data dependence inside one instruction: input operand to output operand
